Description

AI machine translation service software combined with a speech recognition engine provides users with efficient translation capabilities between multiple languages. Whether it's real-time conversations or document file translation, it can be handled with ease. Users can use this software to accurately and smoothly translate into other languages, improving work and communication efficiency.

Features

- *Translate the conference speaker's speech into other languages in real time, and support simultaneous interpretation and voice translation.
- *Support importing audio files and translating them into other selected languages.
- *Support translating DOCX/PDF/TXT and other texts into other selected languages.
- *Support displaying bilingual subtitles in a floating window on Android devices, and can switch languages and translate languages in real time in full screen.
- *Support displaying bilingual subtitles in a floating window through the speech transcription server. In full-screen mode, languages and translation languages can be displayed in left and right columns in real time.
