

Feature:

- * Seating management is a functional module of the conference management system. It supports the seat arrangement function inside the conference room. The administrator can customize the seat layout of different conference rooms, adjust the seat and conference table arrangement.
- * Support the seat viewing and navigation function. The initiator initiates a meeting and then assign seats or randomly arrange seats for the participants. Participants can also choose the seats in the conference room by themselves. After that, all participants can view the preview of the seating arrangement through the Web and APP, and can view their own seat number.
- * Support exporting the preview of the seating arrangement. After the participant signs in by scanning the code at the entrance of the conference room, the preview will automatically pop up, which helps the participant view the seat information in real time.
