

## Description

TTS text to speech

## Feature

- \* Support the operation of text-to-speech conversion through the man-machine interface, the converted voice can be pre-listened, and the converted voice can be used to broadcast to the area within the broadcasting range.
- \* Support Mandarin, English conversion, can customize local dialects. The system can receive text information from a third-party system to realize the function of text-to-speech.
- \* Support the function of voice-to-text conversion, display the text on the display unit, and convert the broadcasted voice content into text and display it on the screen. If the radio content cannot be heard clearly in a high-noise environment, an explosion-proof LED screen is used to display the radio content. And the text is stored for future reference, and can also be uploaded to the upper-level system as an event.
