

## Description

The broadcast control terminal software is an app applied to mobile phone with IOS system. It is an extension application software for the IP PA system, which uses the mobile phone as a tool to make on-demand or broadcast calls to the terminals in the system through wireless connection or mobile network connection.

## Feature

- \* Easy access and convenient operation. Where there is Wifi, you can access the PA system for on-demand, calling, file uploading, and terminal management. Compared with infrared remote control and computer client, it gets rid of the limitation of direction, region and space.
- \* Support user authority management. The broadcast control terminal software can only be used after the user is logged in. Each user can set the authority through the IP PA system software and specify the terminal that can be controlled. Support multiple users to log in at the same time, users with high authority can interrupt tasks of users with low authority.
- \* Support real-time viewing of terminal status. After logging in to the broadcast control terminal, users can view the playback status and connection status of all terminals within their permissions in real time.
- \* Support real-time speech. After logging in to the broadcast control terminal, users can arbitrarily play one or more terminals specified in the authority.
- \* Support program on-demand. After users log in, the music on the server can be on-demand to any one or more terminals within the authority to play.

## Installation requirements

1. Mobile phone installation environment: iOS system version 8.0 or above.
2. System application environment: IP network PA system 2.31.6.5 and above.
