

Description:

* IP Digital Broadcasting App is an intelligent broadcasting software, with functions such as music playback and terminal status in the playback system.

* Application: schools, prisons, office buildings, convention centers, parks, scenic spots, railway stations, large commercial cities, etc.

Feature:

*Supports viewing of details of all terminals online, offline, current tasks, etc., supports searching terminals and viewing terminal lists.

*Supports initiating one-to-one broadcasts to terminals, and can adjust the broadcast volume in real time; supports initiating broadcast tasks in the broadcast room, and can shout to designated terminals or groups.

*Supports initiating one-to-one intercoms to terminals, and can adjust the intercom volume in real time.

*Supports the establishment of music tasks in the broadcast studio, which can play the music (mp3 format files) of the broadcast server to designated terminals or groups.

*Supports configuration of task priority, volume, and playback mode.

*With the task manager function, it can manage the current playback task, and can operate the previous/next song/pause or resume/task volume/end task/switch playback mode; supports the dragging function of the playback progress bar.

*The software supports running on mobile phones with iOS 8.0 or above, and supports downloading in the APP application store.

*The software supports the account and password provided by the login platform, and its functions include terminal status management, remote task management management, session status management, broadcast room management (shouting broadcast/text broadcast), media library resource management, and account information management module.

*Supports the initiation of text broadcast tasks and the use of text recognition functions.

*Supports real-time viewing of media file resources in the media library.

*Supports other function management of the currently logged-in user, including activation of the text recognition function, changing the interface style, and changing the software language.

*Supports personal information management of the currently logged-in user, including modification of the login account and password, and replacement of the local user avatar.
